DataGridView
The datasource of the grid will receive the data in bookDT
Coding basic connection information in a module.
Could use DataSet or DataTable since tables are joined.

Connecting three tables and putting information in the grid.

With DataSet need to tell which table.
The row filter is looking for Didno to match with the user input.

Looking for the filter to give me a view of donations that match with the id in the user input.
Note that I changed Didno to DAmtCont and it is sorting on the contribution.
Note you can refer to the table by name or number (based on which was put into the DataSet first)
Multiple tables in this DataSet - there is the Donor table and the Donation table.
